

WHAT is A-CDM?

A-CDM (Airport collaborative decision making) is an operational process to optimize the turnaround process of aircraft. Furthermore, A-CDM connects the local airport processes with Eurocontrol.

An implemented A-CDM becomes part of numerous processes at the airport, e.g. stand planning or de-icing procedures. LEJ will be the seventh A-CDM airport in Germany.

???

WHO actually benefits from A-CDM?

All of us, to varying degrees. As it needs every one of us to get each flight where it wants to go, and soon, it helps to be able to rely on each other. Adhering to the A-CDM process means that we all work with the same information, with common rules, so all of us can plan our work better. This results in fewer efficiency losses across all stakeholders, which translates into lower fuel burn, more flights per aircraft and day, fewer tugs for the same number of pushbacks, and more. Getting more done with less is always good, and while not everything may work perfectly at all times, part of the process is that we are continuously trying to improve it.

HOW will be communicated?

- Leaflets and publications
- Presentations
- Town Halls and trainings
